

Research Methods for Political Science

The Empirical Approach to Political Science

Thomas Chadeaux

Trinity College Dublin

The scientific approach

How do you *know* things?

- Experience
- Beliefs
- Common sense

The problem with our expertise

- Overconfidence

The problem with our expertise

- Overconfidence
- Linda Problem

The problem with our expertise

- Overconfidence
- Linda Problem
- We overestimate the proba of small events

The problem with our expertise

- Overconfidence
- Linda Problem
- We overestimate the proba of small events
- Bias in incorporating new evidence: Harvard vs the rat

The problem with our expertise

- Overconfidence
- Linda Problem
- We overestimate the proba of small events
- Bias in incorporating new evidence: Harvard vs the rat
- Experts are terrible

- Objective observation, incl. data collection
- Experimentation
- Logical reasoning

Can political science really be scientific?

Humans are not particles...

- Humans are self-reflective, complex, forward-looking creatures
- There is no inter-changeable human

⇒ We study averages.

Humans are unpredictable

- crazy humans \rightarrow averages
- Randomness is part of optimum strategies \rightarrow model it

'Progress has been very slow.'

Actually, progress has been spectacular

Observers affect reality

- Forecasts
- Policies
- Strategies

Attributes of a *scientific* political science project

Data, data, data.

Falsifiable

- “Taxes should be increased” is not value-free
- Taxes destroy jobs is not scientific without evidence

- Data access
- Production transparency
- Analytic transparency

"Screw Occam!"

Why theory, and not just data, matters

Data is great, but...

- Overfitting
- spurious correlations

⇒ theory is critical

Explaining vs Forecasting

- Good explanation, poor prediction
- Good prediction, poor explanation
